DRONEMOBILE DESKTOP INTERFACE V2

UPDATED INTERFACE

In order to make the DroneMobile brand more consistent across all devices, we have launched several design changes to the DroneMobile desktop interface. That said, you'll find that most of the primary functionality of the interface remains essentially the same.

NEW USER REGISTRATION

When registering a new Drone device, the interface will request the device's serial number. Upon submission, DroneMobile will verify whether an authorized dealer has activated the device. If the device has not been activated, the customer will be prompted to wait until installation/registration is complete.
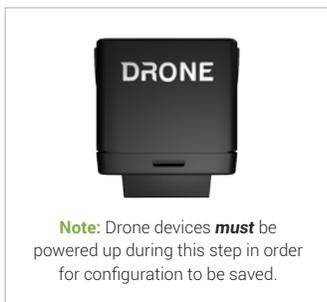

Note: The user will also have the option to bypass this step, in the case of self-installs.

We have implemented this new feature to require that all Drone devices be activated prior to user registration. This ensures proper configuration.

DEALER REGISTRATION NOTICE

We added an additional step in order to prevent consumers from accidentally registering as authorized dealers.

DEALER ACTIVATION

Note: Drone devices *must* be powered up during this step in order for configuration to be saved.

When saving the configuration page, you should now see a pop-up notifying you that configuration is being saved. This step is crucial to making sure all of the correct parameters are saved onto your Drone device. In order to proceed to the testing page, configuration settings must be properly saved onto the Drone device.

We have implemented this new feature to require that all Drone devices be properly configured prior to being delivered to the customer.

FIRMWARE UPDATE

When configuring your Drone device, the DroneMobile server can now recognize if your hardware's firmware is out of date. If so, it will automatically download and apply the update.

During the update process it is critical that the Drone is not disconnected from power as this may lock up the device.

Thank you for reading this overview of the changes made to the DroneMobile desktop interface. These updates are all a part of an effort to reduce complications during installation and registration.
